

# Acrylic Jars

Acrylic is a type of plastic that can be used for jars. This highly desired plastic offers amazing optical clarity and durability. Most manufacturers offer an array of styles and colors leaving you with a very enticing package. For compatibility purposes, acrylic jars have an inner cup which is usually made of polypropylene (PP). This added insert can be produced in any color giving your package a one of a kind look. When compared to glass, acrylic has the added benefit of not cracking when shipped and is lighter in weight so freight costs are less. Acrylic jars give you a high-end look that is hard to beat!
